Mobile Hot Water Solution

Heating Water on the Move, a DIY HWS

If you have an existing cold water system on your motorhome or boat, the addition of the hot water section of the illustration is required. The hot water tank can be made of aluminium, stainless steel, or a dangerous goods drum can be used. These drums are inexpensive and readily available.

Every time the engine is started, the booster pump is activated and the water is heated. The pressure pumps in both the hot and cold water side should be Little Ripper Pumps (4.3 l/min, 35 psi).
